

Funding that keeps your next move moving.

A transaction funding and billing layer for early Canton builders.

ClearRoute turns a full Canton Party ID and a compatible wallet into a reviewed, bounded path to CC funding - with evidence at every step.

PITCH | DEVNET PILOT | OCTOBER 2026

The first transaction is where many Canton teams stop.

Small startups can build a great application and still be blocked by a simple operational gap: they do not have CC in the right wallet, do not know who can approve a transfer, and cannot explain usage or reserve needs later.

01

No starting balance

The team cannot test its first workflow.

02

Treasury friction

Buying or moving CC becomes an engineering task.

03

No evidence loop

Usage, delivery and billing are hard to reconcile.

ClearRoute is the operating layer between a Canton application, its funding need, and the settlement record.

A clear path from request to receipt.

Builder shares full Party ID, wallet provider, amount and

Operator checks party control, network compatibility

Treasury wallet sends a

Builder accepts in their own

ClearRoute reconciles the original tracking ID and

The customer never shares a private key. Approval is not delivery. A timeout never triggers a second monetary submission.

What the demo proves.

Customer view	Public /funding page	Private tracking link	Wallet delivery status
Operator view	Treasury check	Manual approval and limits	Reconcile original transfer
Business view	Usage and billing records	Reserve planning	Audit trail

Five-minute demo script

0:00 Open ClearRoute and explain the startup problem.

1:00 Submit a 1 CC request with a volunteer Devnet party.

2:00 Approve after verifying the recipient.

3:00 Send the offer; recipient accepts in their wallet.

4:00 Show completed evidence and the operator reserve view.

Built for a careful path to production.

ClearRoute is designed to sponsor activity without becoming a customer bank or custody layer. The pilot uses bounded requests, explicit consent, scoped credentials, encrypted refresh-token storage, idempotent transfer IDs and evidence-first reconciliation.

Now

Run the Devnet pilot with a verified NODERS treasury and compatible recipient.

Next

Deploy the Node/Express app with persistent storage on AWS or GCP; configure renewable OIDC credentials and HTTPS.

Later

Add a production wallet/token-standard connector, segregated treasury controls, compliance review and automated gas-station sponsorship.

ClearRoute / Make room for what is next.
