

CC FUNDING FOR CANTON BUILDERS

Fund the next Canton builder.

A funding and billing layer that helps small teams get CC into their wallets and keep building.

Deekshith Reddy
Founder

MAKE ROOM FOR YOUR NEXT MOVE

Build your idea.
We'll help fund
the next step.

Request Canton Coin for your team's Devnet wallet. One request, a human review, and a clear record of delivery.

1. Tell us about your team and wallet.
2. We review your request and recipient.
3. Accept the offer in your wallet and track delivery here.

Devnet test CC only. No payment or invoice is created by this pilot. CC transfers fund your wallet; validator traffic funding is a separate service.

YOUR TEAM'S NEXT STEP

Request Devnet CC

Up to 10 CC per party during this pilot. Requests are reviewed, never automatically paid.

Team / project

Contact email

Full Canton Devnet Party ID

PROBLEM

Funding operations interrupt product work

A small Canton team needs more than a Party ID to start operating.

01

Find CC

Source a starting balance and understand the correct network and wallet.

02

Move it safely

Verify the recipient, track the offer and confirm acceptance.

03

Account for it

Explain delivery, spending and the next funding requirement.

PRODUCT

One public entry point for CC requests

Bring your party. Request funding.

The visitor supplies a team name, full Devnet Party ID, wallet, amount and intended use.

A private tracking link follows the request. No customer account or private key is required for the pilot.

ClearRoute

DEVNET PILOT

Operator sign in

Wallet provider

Amount - CC

e.g. NODERS / Splice wallet

1

What are you testing?

☐ My wallet is on Devnet and can receive and accept Splice wallet transfer offers.

☐ I control this recipient party and agree to share these details with ClearRoute for this test.

Request CC

No password, recovery phrase, private key, or wallet access token is requested. Contact details are visible only to the operator; email ownership is not verified.

CUSTOMER JOURNEY

A reviewed request becomes a wallet delivery

01	02	03	04	05
Request	Review	Send offer	Accept	Confirm
Builder shares a full Party ID and compatible Devnet wallet.	Operator checks recipient control and approves an amount.	Treasury submits one tracked CC offer.	Recipient accepts in their own wallet.	ClearRoute records the wallet-reported outcome and reference.
Recipient requirement	A Devnet wallet that supports Splice transfer offers. Operating a personal validator is not a prerequisite of this pilot.			

Source: DEVNET-PILOT.md. CC delivery does not itself buy validator traffic.

PRODUCT SCOPE

CC top-ups first. Managed sponsorship next.

Controlled top-up

The pilot implements CC transfer offers from a NODERS treasury to compatible recipient wallets.

Manual review, bounded requests and reconciliation give the operator control over each delivery.

Managed funding

Service agreement, allowance and sample-job workflows have confirmed Devnet ledger records.

Future traffic sponsorship needs a verified connector and usage attribution. Pilot top-ups remain separate from USD invoices.

EVIDENCE

Engineering progress with explicit pilot limits

134

Recorded passing tests

91 backend + 43 frontend

5

Confirmed workflow steps

Offer, accept, allowance, job,
complete

2

Devnet service parties

Provider and first customer

Pilot controls

10 CC per request / 100 CC aggregate exposure, excluding fees

BUSINESS MODEL

Recurring fees plus a margin on funded usage

\$50

proposed monthly platform fee

5-10%

proposed margin on sponsored usage

Illustrative customer economics

\$1,000 monthly usage x 7% margin + \$50 fee = \$120 gross monthly service revenue

[GO TO MARKET](#)

Start with teams building their first Canton app

Initial customer

Hackathon teams and small startups that need repeatable CC access but lack dedicated treasury operations.

Acquisition

Invite builders through the funding page. Work with ecosystem mentors and hosted participant providers.

Expansion

Use repeat funding requests to identify teams ready for paid service agreements and spending limits.

Validate before scaling

Measure time to accepted delivery, repeat requests, support effort and willingness to pay.

WHY CLEARROUTE

The opportunity is funding operations

Wallet infrastructure

Holds CC and executes transfers.
ClearRoute uses that infrastructure through its connector.

ClearRoute

Adds a public request, approval policy, customer context and a record that connects the funding decision to its outcome.

Potential long-term advantage

A repeatable operating workflow and integrations that teams can keep using as their funding needs grow.

ROADMAP

Earn reliability before expanding the network

NEXT DEMO

Prove real receipt

Finish a volunteer transfer with recipient acceptance and a wallet-confirmed transaction reference.

HOSTED PILOT

Operate continuously

Deploy HTTPS with persistent storage. Verify credential renewal, restore procedures and monitoring.

COMMERCIAL

Validate paid funding

Confirm demand and unit economics. Add production connectors, treasury policies and jurisdiction-specific review.

FOUNDER AND ASK

Help the next Canton team start building

Deekshith Reddy

Founder, ClearRoute

Seeking pilot builders and ecosystem partners to validate reliable CC delivery and recurring demand.

github.com/deekshithreddy1/ClearRoute

Near-term goal

One complete external-wallet demo, followed by a hosted pilot with repeat users.

APPENDIX

Evidence and assumptions

Product and limits	DEVNET-PILOT.md and backend/public-funding.ts document Devnet scope, transfer offers and 10 / 100 CC limits.
Product screenshots	Actual public /funding page captured locally on 8 October 2026. The two views show the same product at desktop and narrow widths.
Engineering evidence	verification-final.log records 91 backend and 43 frontend passing tests plus a production build. This deck does not rerun or certify production operation.
Ledger evidence	User-supplied 7 October Devnet journal reports confirmed offer, accept, allowance, job and completion steps. These are service records, not proof of native CC delivery.
Economics and roadmap	The user proposed a \$50 monthly fee and 5-10% margin. The \$120 example is arithmetic at a 7% margin. Acquisition, partnerships and commercial milestones are proposals.
